Building and Employing a SOE Model using IRIS-Toolbox for Matlab

Michal Andrle

IMF/RES Economic Modeling Unit

Washington, D.C. March 10-11, 2011

Outline

The goal of the talk/course is to provide a 'hands on' experience of building a small open economy model.

1. Building a SOE model

- infrastructure & software quick review
- reviewing stylised facts
- motivating the model structure

2. The Model - parameterization & properties

- parametrization, evaluating IRFs
- pseudo-real time forecasting properties, model's moments

3. Creating scenarios & baseline forecast

- topical scenarios exercises
- determining initial conditions, output-gap estimation, interpreting history
- conditioning on exogenous assumptions
- imposing expert judgement
- detailed analytics of the forecast dynamics (decomposition)

Focus on both economics & technique/infrastructure development. We'll work with the model code and run scenarios...

Technical Infrastructure & Software

The project is based on the following components:

1. MATLAB

- linear algebra numerical software, OOP support, weakly-typed, interpreted language and computing system (based on Fortran, C++ & Java)
- understanding 'object-oriented approach' exercises, getting the intuition
- 2. IRIS-Toolbox
 - Matlab-based Object-Oriented toolbox for DSGE modelling and time series
 - enriches Matlab with new types/objects (time series, model, database,...)
- 3. LATEX, GIT
 - LATEX used as a back-end for generating PDF reports
 - GIT distributed version control system keeps track of our project, changes and branches

Stylised Facts (Indonesia)

...TBA

Michal Andrle (IMF/RES)

Building and Employing a SOE Mode

Model

The model is a reduced-form DNK model in line with GPM-philosophy

- Theoretical motivation with New Keynesian monetary economics
- Flexible & pragmatic approach for forecasting and policy analysis
- Focus on business cycle frequencies

Deviations from a canonical IMF's GPM-SOE

- Accounting for a trend in real exchange rate
- Explicit treatment of administrated/regulated prices
- Rest-of-the-World (RoW) block treated as closed economy GPM
- Minor variations in dynamic specification

The Model – A Bird's Eye View

Simplified version of core behavioral relationships:

$$y_{t} = \beta_{1} y_{t+1} + \beta_{2} y_{t-1} - \beta_{3} (\hat{i}_{t} - \pi_{t+1}) + \beta_{4} y_{t}^{*} + \beta_{5} z_{t} + \varepsilon_{t}^{y}$$
(1)

$$\pi_t = \lambda_1 \pi_{t+1} + (1 - \lambda_1) \pi_{t-1} + \lambda_3 y_t + \lambda_4 z_t + \varepsilon_t^{\pi}$$
(2)

$$i_{t} = \gamma_{1}i_{t-1} + (1 - \gamma_{1})\left[\bar{i}_{t} + \gamma_{2}(\pi 4_{t+3} - \bar{\pi 4}_{t+3}) + \gamma_{3}y_{t}\right] + \varepsilon_{t}^{i}$$
(3)

$$i_{t} = i_{t}^{*} + s_{t+1}^{e} - s_{t} + prem_{t}$$
(4)

Trend-cyclical structure: $X_t = \bar{X}_t + x_t$

- the model does not feature complete trend-cycle dichotomy
- flexible trend specification; either AR(1) or version of LLT model

$$\begin{aligned} X_t &= X_{t-1} + G_t + \varepsilon_t^X \qquad \varepsilon_t^X \sim \mathcal{N}(0, \sigma_x^2) \\ G_t &= \rho G_{t-1} + (1-\rho)G_{ss} + \varepsilon_t^G \qquad \varepsilon_t^G \sim \mathcal{N}(0, \sigma_G^2) \end{aligned}$$

A (10) A (10)

(5) (6)

The Model – A Bird's Eye View (ii)

Trend Real-Exchange Rate Appreciation

- Trend real exchange rate appreciation featured in many transition economies (productivity gains in non-traded goods, HBS effect)
- Hybrid-Uncovered Interest Parity (UIP) needs to be modified

$$i_t = i_t^* + s_{t+1}^e - s_t + prem_t \tag{7}$$

$$s_{t+1}^{e} = \sigma s_{t+1} + (1 - \sigma) \left\{ s_{t-1} + (\bar{d}z_t - \bar{\pi}_t^* + \bar{\pi}_t) \right\}$$
(8)

Steady-state key arbitrage relationship:

$$r = r^* + dz + prem \iff i - i^* = prem + ds + \pi^* - \pi$$
 (9)

The Model – A Bird's Eye View (iii)

Administrative prices

- Exogenous process for contribution of administrated prices to headline CPI
- Weight of admin. prices in headline 18%
- In practise, not 'truly' exogenous hydrocarbons and energy prices,...
- Parameter "ρ" co-determines 'expectations-spillovers' and the transmission mechanism

$$\pi_t = \alpha \pi_t^{net} + (1 - \alpha) \pi_t^{adm} + \varepsilon_t^w$$
(10)

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

$$\pi_t^{adm} = \rho \pi_{t-1}^{adm} + (1-\rho)\pi^{ss} + \varepsilon_t^{adm}$$
(11)

Commodity prices

TBA

The Model – Parametrization (i)

There are three groups of parameters

Steady-state parameters & 'equilibriums'

- inflation targets, equilibrium real interest rate, potential output growth,...

Dynamic parameters

- persistence, output gap & exchange rate loadings,...

Stochastic parameters

- std. errors of shocks and measurement errors

Calibration vs. Estimation

- Short, noisy and unreliable data
- The economy evolves very quickly, the model is built for recent and future economic development
- Identification problems, which Bayesian methods do not solve

・ ロ ト ・ 同 ト ・ 目 ト ・ 目 ト

The Model – Parametrization (ii)

Parameterization is tested by reviewing many model properties:

- (i) Economics of Impulse Response Function (IRF)
- (ii) Transfer function properties in time and frequency domain
- (iii) Quasi real-time historical forecasting performance
- (iv) Interpretation of historical shock decomposition

(v) ...

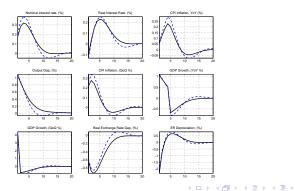

Best is the enemy of the 'good'...

The Model – Impulse Response Function (iii)

Impulse Response Functions (IRF) - 'hands on exercises'

- Demand & Supply/Cost-push Shocks
- Exchange rate, monetary policy, administrated prices
- Understanding disinflation in the model, ...

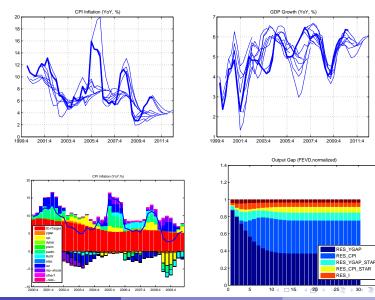

Michal Andrle (IMF/RES)

Building and Employing a SOE Model

The Model — Properties evaluation...(iv)

Michal Andrle (IMF/RES)

Building and Employing a SOE Model

Building Scenarios – Exercises & Analysis

• Falling behind the curve – delayed monetary policy

- monetary accommodation dynamics implications
- the role of anticipations and credibility
- understanding economics and mathematics of reactions to anticipated events

• Administrative prices – expectations spillovers

- expectation spillovers the persistence of beliefs
- the role of forcing terms in conditioning on exogenous variables
- Reserve requirements & risk-premiums
 - simulating 'reserve-requirements' changes in reduced form DNK model (?)

Baseline Forecast

Analyzing the initial state of the economy

- output-gap and potential output growth
- real exchange rate trend, risk premiums
- interpreting the history using the model,...

Conditioning information

- foreign economy development, inflation target, regulated prices
- implementing 'now-casts' and near-term forecasts
- imposing expert-judgement

Forecast dynamics decomposition and analysis

- factors behind the forecast, delta-accounting w.r.t previous forecast
- sensitivity analysis & scenarios

A (10) F (10) F (10)

Baseline Forecast – Initial State

Three basic approaches

Univariate

- ad-hoc detrending methods, pros & cons
- HP/Leser filter, imposing prior restrictions

Multivariate UC models with ad-hoc detrending

- pros & cons
- IMF's 'ModYUC' model, structure and properties

Model consistent filter & 'structural' shocks identification

- most challenging, consistent and insightful variant
- running counter-factual simulations

A > + = + + =

Baseline Forecast – Initial State (ii)

Univariate detrending

- Stochastic trends extracted by band-pass or high pass Filtering (e.g. HP filter)
- Not much economics, business cycle identified with frequency-domain arguments (e.g. 6-32 quarters cycles)
- Plain/naive HP filter features very unpleasant 'end-point properties' and is ill-suited for real-time analysis
- Contrary to common belief, the HP/band-pass filter does not induce spurious cycles. HP is not very 'sharp' filter, its gain is quite smooth

Prior-Consistent (LRX) filter with prior restrictions (exercise)

- User can impose the trend growth rate or the size of the gap with arbitrary precision
- Re-formulate the LLT problem with additional constraints, see e.g. Berg et al. (2006b)

$$\min_{\{T_t\}_1^{\mathbb{T}}} = \sum_{t=1}^{\mathbb{T}} \left[(Y_t - T_t)^2 + \lambda (\Delta^2 T_t)^2 \right] +$$
(12)

$$+ \sum_{i \in \mathbb{P}^{\mathbb{Y}}} \lambda_i^{\mathsf{Y}} \{ (Y_i - T_i) - \tilde{Y}_i^{\text{fix}} \}^2 + \sum_{j \in \mathbb{P}^{\mathbb{T}}} \lambda_j^{\mathsf{T}} \{ (T_j - T_{j-1}) - \tilde{G}_j^{\text{fix}} \}^2$$

Baseline Forecast – Initial State (ii)

Multivariate methods of trend-cyclical decomposition

- Combination of stochastic-trends with restrictions based on economic theory, most often a Phillips Curve and 'Okun's Law'
- Can employ multiple indicators of 'output gap' capacity utilisation, unemployment,...to search for co-cycles and phase-shifts
- Most convenient to cast into state-space form, particularly due to very easy handling of missing observations

Model-Consistent Estimation of Initial Conditions

- Identification of unobserved variables using the complete REE model
- The State-Space form of the ARIMBI model analyzed using the insights from Kalman & WK filtering
- Allows to interpret the past development of the economy using the model optics and carry out counterfactual scenarios
- Output-gap estimates are consistent with the model and may/should differ from naive ad-hoc approaches

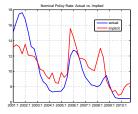

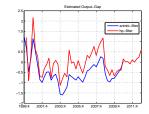

For theory of Kalman and WK filters, see Anderson and Moore (1979) and Wiener (1949)

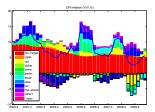

Baseline Forecast - Initial State (iii)

Initial Conditions (exercises & discussion)

- Counterfactuals acatual vs. model-based estimates of policy rates
- 'Full-filter' estimate vs. HP estimates of output-gap
- Historical shock decompositions taking the challenge

Building and Employing a SOE Model

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Baseline Forecast – Conditioning Information

Conditioning information

- The forecast features endogenous interest rate response
- Conditioning on selected variables and pieces of information
 - RoW: foreign interest rate, inflation and prices
 - Inflation target evolution
 - Evolution of exogenous trends & equilibrium values (potential output, etc.)

Imposing expert judgment

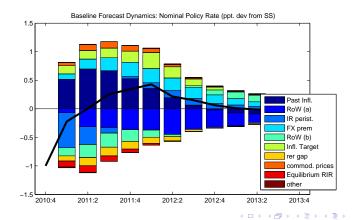

- Imposing values of selected macro-variables by a specified path of structural shocks
 - key question is selecting a particular shock to create a 'story' (e.g. demand or supply higher inflation pressures?)
- Hard-tunes vs. 'Soft-tunes/WZ'
 - Hard-tunes point fix of a variable by a point shock impulse
 - Soft-tunes/Waggoner-Zha select 'most likely' set of shocks

Algorithm used is a generalization of Waggoner and Zha (1999) allowing for anticipated shocks, described in Andrle (2007)

Baseline Forecast – Dynamics & Analysis

Apart from economic reasoning, formal methods help to

- Understand and communicate the dynamics behind the baseline
- Explain deviations from the previous forecast and thus
- Provide clear picture why new interest rate path is projected

Thank you for your attention.

Michal Andrle (IMF/RES Modeling Unit)

Michal Andrle (IMF/RES)

Building and Employing a SOE Model

Hands-On Exercises in Matlab

List of core exercises:

- (i) Object-oriented programming a primer (talking cats & dogs...?)
- (ii) Inspecting the model object & databases
- (iii) Importance of version control for the project, examples (GIT, SVN, etc.)
- (iv) Writing (understanding and modifying) a flexible IRFs simulator & reporting
- (v) Running IRFs with multiple parameterizations, sensitivity analysis
- (vi) Building scenarios
 - falling behind the curve, administrated prices, RoW, ...
- (vii) Initial conditions identification
 - HP/Leser filter with priors, Kalman filter basics, shock-decompositions
 - running historical counter-factual, missing observations
- (viii) Simulation dynamics decompositions
 - baseline forecast delta-accounting, new vs. old forecast, scenario comparison
